Rethinking American Electoral Democracy - Matthew J. Streb 2015-10-30

While frustration with various aspects of American democracy abound in the United States, there is little agreement over—or even understanding of—what kinds of changes would make the system more effective and increase political participation. Matthew J. Streb sheds much-needed light on all the major concerns of the electoral process in the thoroughly revised third edition of this timely book on improving American electoral democracy. This critical examination of the rules and institutional arrangements that shape the American electoral process analyzes the major debates that embroil scholars and reformers on subjects ranging from the number of elections we hold and the use of nonpartisan elections, to the presidential nominating process and campaign finance laws. Ultimately, Streb argues for a less burdensome democracy, a democracy in which citizens can participate more easily in transparent, competitive elections. This book is designed to get students of elections and American political institutions to think critically about what it means to be democratic, and how democratic the United States really is. Part of the *Controversies in Electoral Democracy and Representation* series, edited by Matthew J. Streb.

Point, Click, and Vote - R. Michael Alvarez 2003-12-31

Whether responding to a CNN.com survey or voting for the NFL All-Pro team, computer users are becoming more and more comfortable with Internet polls. Computer use in the United States continues to grow—more than half of all American households now have a personal computer. The next question, then, becomes obvious. Should Americans be able to use the Internet in the most important polls of all? Some advocates of Internet voting argue that Americans are well suited to casting their ballots online in political elections. They are eager to make use of new technology, and they have relatively broad access to the Internet. Voting would become easier for people stuck at home, at the office, or on the road. Internet voting might encourage greater political participation among young adults, a group that stays away

from the polling place in droves. It would hold special appeal for military personnel overseas, whose ability to vote is a growing concern. There are serious concerns, however, regarding computer security and voter fraud, unequal Internet access across socioeconomic lines (the "digital divide"), and the civic consequences of moving elections away from schools and other polling places and into private homes and offices. After all, showing up to vote is the most public civic activity many Americans engage in, and it is often their only overt participation in the democratic process. In *Point, Click, and Vote*, voting experts Michael Alvarez and Thad Hall make a strong case for greater experimentation with Internet voting. In their words, "There is no way to know whether any argument regarding Internet voting is accurate unless real Internet voting systems are tested, and they should be tested in small-scale, scientific trials so that their successes and failures can be evaluated." In other words, you never know until you try, and it's time to try harder. The authors offer a realistic plan for putting pilot remote Internet voting programs into effect nationwide. Such programs would allow U.S. voters in selected areas to cast their ballots over any Internet connection; they would not even need to leave home. If these pilot programs are successful, the next step is to consider how they might be implemented on a larger scale in future elections.

Mousepads, Shoe Leather, and Hope - Zephyr Teachout 2015-12-03

Howard Dean's campaign for president changed the way in which campaigns are run today. With an unlikely collection of highly talented and motivated staffers drawn from a variety of backgrounds, the Dean campaign transformed the way in which money was raised and supporters galvanized by using the Internet. Surprisingly, many of the campaign staff members were neither computer whizzes nor practiced political operatives, even though that is how some of them are identified today. This book allows key individuals in the campaign the chance to tell their stories with an eye to documenting the Internet campaign revolution and providing lessons to future campaigns. Howard Dean's inspirational statement of what it took for his campaign to get as far as it did-"mousepads, shoe leather, and hope"-holds great wisdom for anyone campaigning today, especially the 2008 presidential candidates.

Inzell Lectures on Orthogonal Polynomials - Wolfgang zu Castell 2005

Based on the success of Fourier analysis and Hilbert space theory, orthogonal expansions undoubtedly count as fundamental concepts of mathematical analysis. Along with the need for highly involved functions systems having special properties and analysis on more complicated domains, harmonic analysis has steadily increased its importance in modern mathematical analysis. Deep connections between harmonic analysis and the theory of special functions have been discovered comparatively late, but since then have been exploited in many directions. The Inzell Lectures focus on the interrelation between orthogonal polynomials and harmonic analysis.

Advances in Computer, Information, and Systems Sciences, and Engineering - Khaled Elleithy

2007-06-06

The conference proceedings of: International Conference on Industrial Electronics, Technology & Automation (IETA 05) International Conference on Telecommunications and Networking (TeNe 05) International Conference on Engineering Education, Instructional Technology, Assessment, and E-learning (EIAE 05) include a set of rigorously reviewed world-class manuscripts addressing and detailing state-of-the-art research projects in the areas of: Industrial Electronics, Technology and Automation, Telecommunications, Networking, Engineering Education, Instructional Technology and e-Learning. The three conferences, (IETA 05, TENE 05 and EIAE 05) were part of the International Joint Conference on Computer, Information, and System Sciences, and Engineering (CISSE 2005). CISSE 2005, the World's first Engineering/Computing and Systems Research E-Conference was the first high-caliber Research Conference in the world to be completely conducted online in real-time via the internet. CISSE received 255 research paper submissions and the final program included 140 accepted papers, from more than 45 countries. The whole concept and format of CISSE 2005 was very exciting and ground-breaking. The powerpoint presentations, final paper manuscripts and time schedule for live presentations over the web had been available for 3 weeks prior to the start of the conference for all registrants, so they could pick and choose the presentations they want to attend and think about questions that they might want to ask. The live audio presentations were also recorded and are part of the permanent CISSE archive, which includes all power point presentations, papers and recorded presentations. All aspects of the conference were managed on-line; not only the reviewing, submissions and registration processes; but also the actual conference. Conference participants - authors, presenters and attendees - only needed an internet connection and sound available on their computers in order to be able to contribute and participate in this international ground-breaking conference. The on-line structure of this high-quality event allowed academic professionals and industry participants to contribute work and attend world-class technical presentations based on rigorously refereed submissions, live, without the need for investing significant travel funds or time out of the office. Suffice to say that CISSE received submissions from more than 50 countries, for whose researchers, this opportunity presented a much more affordable, dynamic and well-planned event to attend and submit their work to, versus a classic, on-the-ground conference. The CISSE conference audio room provided superb audio even over low speed internet connections, the ability to display PowerPoint presentations, and cross-platform compatibility (the conferencing software runs on Windows, Mac, and any other operating system that supports Java). In addition, the conferencing system allowed for an unlimited number of participants, which in turn granted CISSE the opportunity to allow all participants to attend all presentations, as opposed to limiting the number of available seats for each session. The implemented conferencing technology, starting with the submission & review system and ending with the online conferencing capability, allowed CISSE to conduct a very high quality, fulfilling event for all participants. The Human Society and the Internet: Internet Related Socio-Economic Issues - Won Kim
2003-06-29

During the past several years, the world has entered the first phase of the Internet Revolution. Investors showed confidence and faith in the prospects of the Internet driven economy. In the US alone, some 30,000 dot com companies have sprung up to support electronic commerce with a wide variety of business models, technologies, and/or items or services to sell or even give away. Traditional businesses, so called brick and mortar, or offline, businesses, have started to respond to challenges by Internet based new competitors by augmenting their own businesses with Internet based, or online, businesses and/or filing lawsuits against them. The initial business to consumer orientation of electronic commerce is giving way to business to business commerce, with large corporations forming electronic exchanges or consortia to conduct commerce among members. Government, industry, and civic groups have started

addressing social issues related to the Internet, such as taxation on electronic commerce, privacy, intellectual property rights, security, hacking, cyber crimes, digital divide, etc. Governments have started legitimizing electronic signatures and stepping up efforts to track down perpetrators of cyber crimes. The courts have started to wrestle with issues of privacy, intellectual property rights, crimes, and impediments to Internet driven economy.
